Python Environment

STEP 1: Install Miniconda

- Miniconda - Install <https://docs.conda.io/projects/miniconda/en/latest/miniconda-install.html>
- Once you did the above, you should see the prompt like this on your terminal, with (base).

```

Last login: Mon Sep 25 21:59:51 on ttys002
(base) vijayachandranvm@vijayachandrans-MacBook-Pro ~ %
```

- for windows, search for anaconda/miniconda prompt

STEP 2: Create a conda virtual environment

#below the environment is created as ai. Type the following on terminal

```
conda create -n ai python=3.10
```

#activate ai virtual environment.

```
conda activate ai
```

```
[(base) vijayachandranvm@vijayachandrans-MacBook-Pro ~ % conda activate ai
(ai) vijayachandranvm@vijayachandrans-MacBook-Pro ~ %
```

You should see (ai) in your terminal. So you are inside that environment.

#install dependencies using pip.

```
pip install numpy
pip install openai
pip install hugging face
pip install langchain
pip install pandas
pip install jupyter notebook
```

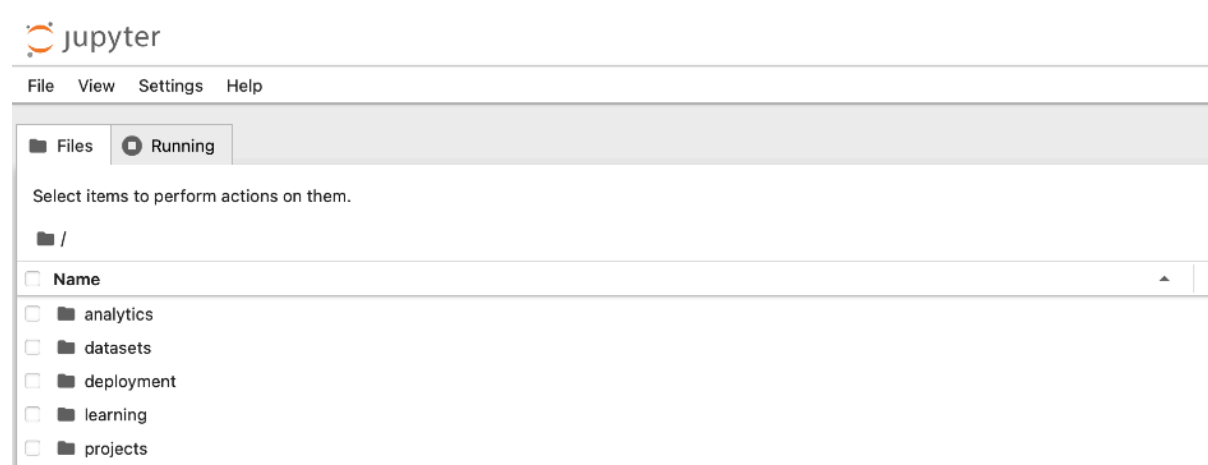

STEP 3: Work using Jupyter notebook

Type Jupyter notebook

```
(ai) vijayachandranvm@vijayachandrans-MacBook-Pro workspace % pwd
/Users/vijayachandranvm/workspace
(ai) vijayachandranvm@vijayachandrans-MacBook-Pro workspace % jupyter notbook
```

Note in the above I called Jupyter notebook from workspace directory. So I can create/access all files and subfolders from that directory only. So type Jupyter notebook where you want to work from.

This will open a window in your default browser, like below. Navigate to the folder you want to work on.

Create a notebook to work from:

Click New->Notebook-> Select Python 3 (ipykernel)

It will create an untitled notebook. You can rename it by clicking on Untitled. Then you can load python modules. Here when I tried to load numpy, it said Module not found. So you open a new anaconda terminal, activate 'ai' environment and the type 'pip install numpy'

```
jupyter Untitled Last Checkpoint: 1 minute ago
Edit View Run Kernel Settings Help

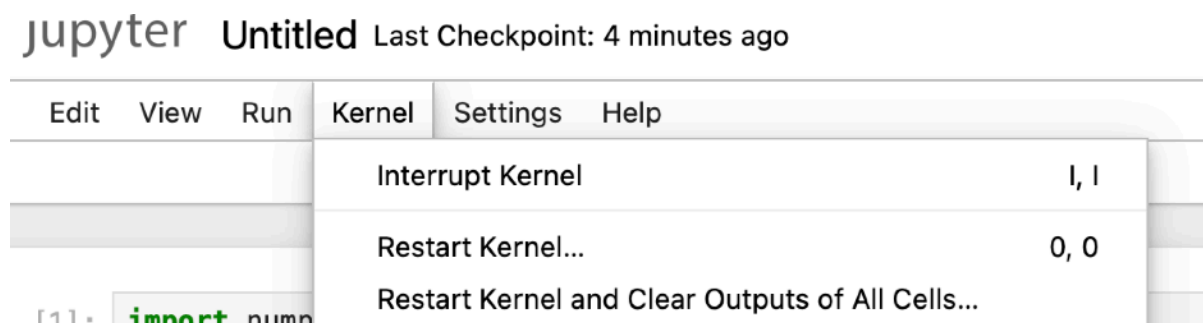

[1]: import numpy as np

-----
ModuleNotFoundError                                Traceback (most recent call last)
Cell In[1], line 1
----> 1 import numpy as np

ModuleNotFoundError: No module named 'numpy'

[ ]:
```

Once you have installed, do Kernel->Restart Kernel and Clear outputs

Checking now:

```
jupyter Untitled Last Checkpoint: 6 minutes ago
Edit View Run Kernel Settings Help

[1]: import numpy as np
[2]: np.__version__
[2]: '1.26.0'
[ ]:
```

We will use Jupyter notebook extensively, so get this step done.

New ideas and work involve new modules that need to be load. All you need to do is pip install <module name>

Ex. Install numpy

```
(ai) vijayachandranvm@vijayachandrans-MacBook-Pro ~ % pip install numpy
```
